

PINPOINT PERSONAL PAGING TRANSMITTER

This unit is a portable paging transmitter to enable the direct reporting of incidents by the user to pagers carried by responding staff or, in conjunction with a paging receiver, to a Pinpoint System installed in a building. The PPPT is normally specified for large external areas where coverage using Pinpoint External Receiver Units is not possible or practicable.

The PPPT is housed in an ergonomic hi-impact casing and features a two digit backlit display with function icons for battery status, motion sensor activation, signal transmission, sounder and charging status. The display will back light when transmitting or altering the operational status.

There are two trigger buttons which provide the possibility of three activation modes (A, B, A + B) and these can be programmed to send individual text and/or zone information. Alternatively, both trigger buttons can be programmed to send the same information.

The unit also features a snatch lanyard which plugs into the bottom of the unit. This provides automatic emergency signalling if the unit is forcibly wrenched from the wearer.

There is a motion sensing accelerometer which recognises horizontal, vertical and angular tilt, is fully programmable and will not start its countdown sequence until the programmed criteria are met.

The PPPT is powered by a custom (NiMh) battery pack which will provide up to seven days service between charges. An intelligent slot-in charger allows rapid re-charging in less than 1 hour.
